Greetings,

Thank you for your interest in our Model WT-2000 Interactive Driving Simulator products featuring the **STISIM Drive™** Interactive Software. **STISIM Drive™** has been developed for evaluating human subject impairment and proficiency, and is based on over 35 years of published research on vehicle dynamics and driver behavior.

These simulators are being used by driver rehabilitation programs for evaluating driver performance, and selection and training on adaptive driving controls. In addition, they are being used in many other applications including medical research for investigating driver performance under various conditions such as drug and alcohol use, fatigue, and disease.

The WT-2000 Interactive Driving Simulators can assess cognitive and psychomotor capability on a day-to-day basis. In addition to standard driving scenarios, the **STISIM Drive™** software allows the user to conveniently customize an assessment to a specific driver's needs. It can record a wide variety of driver performance measures (number and type of accidents, lane deviation, speed control, divided attention, reaction time, etc). Plus, the '**replay**' **feature** can store and rerun every scenario *exactly* as it was driven.

Enclosed please find Model WT- 2000 Interactive Driving Simulator product literature. If you have any questions about the enclosed material, please call us at (800) 548-4550 or contact us via e-mail at [atpwork@aol.com](mailto:atpwork@aol.com).
